Kalamazoo, MI 49009

Violation Response:

Wright coating received a violation for Coating Lines (FG-Line) for PTI#212-16, Special Condition V.1, for not completing Method 24 Testing on Coatings and has not obtained approval from EGLE to use Manufacturers formulation data. Wright coating has completed Method 24 Testing (see attached results). This information has been sent to EGLE AQD staff for the determination of formulation data that is to be used for calculating Wright Coating's Air Emissions for the annual MAERS report. Once a determination and approval has been obtained, the new formulation data will be used for MAERS calculations.

Wright Coating also received a violation for Coating Lines (FG-Lines) for PTI#212-16, Special Condition III.2, for burning used coating-booth filters in the burn-off ovens because this is not proper disposal and does not minimize introduction of air contaminants to the outer air. Wright coating has performed a TCLP for VOC and Ignitability on the spent booth filters (see attached results). Wright Coating has also sent the necessary information to EGLE Air Quality Division to modify PTI#212-16 to include burning of spent filters in the burn-off ovens. Wright is currently waiting for the response from EGLE Air Quality Division -Permit Section to move forward with bringing us back into compliance.

Sincerely,

Jim Grimes
